SUMMARY

9 years of software engineering experience across fintech, payments, hospitality technology, and AI products, with a focus on Python, AWS, financial data processing, APIs, and event-driven systems. Built and operated transaction-processing workflows handling ~500,000 financial transactions per day, including API ingestion, asynchronous processing, batch payment files, reconciliation, analytics pipelines, and production data investigation. Hands-on across architecture, implementation, SQL, deployment pipelines, AWS infrastructure, and production reliability, with experience operating backend systems supporting 100,000+ users across 10,000 organizations. Looking to deepen an IC track focused on large-scale data infrastructure and processing systems.

EXPERIENCE

Senior Backend Engineer — Part-time Project

2026

Parrot Software (YC S20)

Mexico City, Mexico

Owned the architecture and migration of Parrot's user and permissions model from legacy store-level and external-service implementations to an organization-level model supporting multiple stores per organization. Evaluated microservices, monolith, and modular-monolith approaches and selected a modular Django architecture to reduce operational complexity during migration.

- Designed the `users\_roles` Django module and User Management API v2.0 supporting 100,000+ users across 10,000 organizations, including schemas, indexes, roles, permissions, and organization-level ownership.
- Authored the migration architecture and rollout strategy using checksum-based integrity validation, rollback mechanisms, and compatibility flags instead of introducing dual-write complexity.
- Executed a staged data migration covering new-model users, Supabase-backed users, and the remaining legacy population while preserving compatibility with existing systems.
- Consolidated user and permissions logic into the Django modular monolith, reducing cross-service communication and improving data traceability.

Product Engineer

2025

VisitoAI

Mexico City, Mexico

Owned the backend booking and payment workflow for hotels, boutique hotels, Airbnb operators, and property owners. Built the path from conversational data capture and availability checks through payment and reservation confirmation using Python, Azure AI, Cloudbeds, Stripe, and RabbitMQ.

- Built the end-to-end workflow: WhatsApp inquiry → Azure AI tool call → Cloudbeds availability → Stripe payment link → Stripe webhook → Cloudbeds reservation → guest notification.
- Integrated Cloudbeds and Stripe REST APIs into asynchronous backend workflows for availability, payment, and booking data processing.
- Implemented prompt-driven tool orchestration with a human-handoff path that paused automation when requests could not be resolved.
- Instrumented lead progression across availability, payment-link, and confirmation stages to analyze funnel drop-off.

Tech Lead

2020 – 2025

Fondeadora Empresarial

Mexico City, Mexico

Operated as a hands-on technical IC across payments, transfers, data processing, infrastructure, and product delivery. Coordinated technical decisions across a six-engineer team while retaining direct ownership of Python services, AWS infrastructure, financial integrations, and deployment workflows.

- Designed the SPEI integration architecture for consumer and B2B products, building Python/FastAPI webhook services for deposit processing and a provider boundary that normalized SOAP/XML financial events into JSON for downstream systems.

- Built batch payment-processing workflows allowing B2B customers to upload CSV files containing thousands of transactions for validation, transformation, and asynchronous payment execution.
- Built SQL/PostgreSQL reporting and reconciliation workflows used for monthly consumption reports, transaction analysis, and financial month-end reconciliation.
- Designed backend and AWS serverless infrastructure across Lambda, SQS, dead-letter queues, CloudWatch, and GitHub Actions, standardizing CI/CD workflows across backend services.

Software Engineer

Fondeadora (YC W20)

2017 – 2020

Mexico City, Mexico

Built and operated backend and data-processing systems for financial transactions, transfers, cards, analytics, and provider integrations in an AWS serverless environment.

- Designed and operated financial processing systems handling ~500,000 transactions per day using Python, AWS Lambda, SQS, Step Functions, and asynchronous event-driven workflows.
- Built FastAPI-based webhook processing for card-payment and SPEI events, validating incoming provider data and routing financial transactions into downstream processing workflows.
- Built data normalization workflows for inconsistent merchant and business-name records, standardizing heterogeneous source values for downstream financial processing and analysis.
- Operated analytics and investigation workflows across RudderStack, Amazon Redshift, S3, Athena, PostgreSQL, and production transaction data for reporting, reconciliation, fraud investigation, and operational analysis.

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript, Kotlin

Backend / APIs: FastAPI, Django, Django REST Framework, REST APIs, webhooks, SOAP/XML integrations

Data Engineering: Batch processing, CSV ingestion, data normalization, ETL/ELT patterns, transaction processing, financial reconciliation, analytics pipelines

Databases / Analytics: PostgreSQL, Amazon Redshift, Redis, Supabase, Amazon Athena

AWS / Cloud: AWS Lambda, S3, SQS, Step Functions, IAM, CloudWatch, serverless architectures

Messaging / Event Systems: Kafka, RabbitMQ, SQS, FIFO queues, dead-letter queues

Analytics / Data Movement: RudderStack, Redshift, S3

CI/CD: GitHub Actions, backend and frontend deployment pipelines

Architecture: Event-driven systems, asynchronous processing, modular monoliths, domain boundaries, repository pattern, hexagonal architecture

Financial Systems: SPEI, Stripe, transaction workflows, card payments, reconciliation, idempotency, provider integrations

AI / Integrations: Azure AI, LLM tool calling, prompt-based orchestration, Cloudbeds API

Languages: Spanish (Native), English (Professional)

CERTIFICATIONS

AWS Certified Solutions Architect – Associate — AWS | 2026

Credential ID: 537340587
